PROMISE FERTILITY CENTER

IVF Hospital Information Management System

A unit of Sri Kumaran Hospital | Presentation & Demo Guide

A single, calm, tablet-first system that carries every patient from first consultation through stimulation, embryology, transfer and billing - with the whole clinic in one place.

Live demo link	promise-fertility.vercel.app

Open on an iPad in Safari for the full experience. Use Share to Add to Home Screen to run it full-screen like an app.

1. What this system is

Promise Fertility HMIS is a purpose-built software system for the fertility clinic. It replaces scattered registers, spreadsheets and paper files with one secure, connected record that the whole team shares. It is modelled on the clinic's existing Medics workflow, rebuilt as a modern, tablet-first application the staff can use at the chairside.

Why it matters for the clinic

- **One source of truth.** Patient, couple, cycle, lab and billing data live together and stay linked - no re-entering the same details in three places.
- **Built for the IVF journey.** Stimulation monitoring, OPU, embryology, vitrification and outcomes are first-class features, not generic forms.
- **Tablet-first.** Designed for iPad at the chairside and the lab bench, in portrait or landscape.
- **Safe & accountable.** Role-based access, locked financial records, and a full audit trail of who did what.
- **Live insight.** The dashboard and analytics show cycles, outcomes, 90-day conversion and billing in real time.

---

2. How to start

Open **promise-fertility.vercel.app**. Every staff member signs in with their own email and password on a single, shared login screen - what they can see and do is decided by the **role** an administrator assigns to their account.

Roles & what each one sees

Role	Typical access
Administrator	Everything, including Users, Setup and the Audit log
Doctor	Clinical records, cycles, reports, templates
Nurse	Patients, visits, cycles, stimulation, inventory
Embryologist	Embryology, semen, vitrification, storage, PGD
Front Desk	Registration, appointments, documents, billing
Billing	Bills, receipts, inventory

For today's demo - one-tap logins

On the sign-in screen, the **Quick demo access** buttons sign you in instantly as any role so you can show the doctor how the system changes per person:

Button	Signs in as
Admin	Full access - use this for the main walkthrough
Doctor	Clinical view
Nurse	Front-desk + clinical
Embryologist	Lab & embryology view
Front Desk	Reception view
Billing	Finance view

(These demo buttons are for the presentation only and will be removed before real go-live.)

3. The complete workflow - a patient's journey

This is how a couple moves through the system from first visit to outcome. Each step is a screen in the app.

Step	What happens
1. Register the patient	Front Desk registers the patient (name, age, phone, photo / ID). The system generates an MRN automatically and warns about duplicates.
2. Open the EMR	The patient record holds identity, visit timeline, clinical forms, consents, documents and billing. The doctor records visits and signs them.
3. Create the couple	Link the partner to form a couple. A Couple Number is generated. All IVF cycles belong to the couple.
4. Start an IVF cycle	Create a cycle (treatment type, protocol, ovum/sperm source). The cycle has its own workspace with a status that moves as treatment progresses.
5. Stimulation monitoring	Record day-by-day stimulation: medications, follicular scan, endometrium, E2/P4. A response chart plots follicles, endometrium and E2. 'Repeat dosage' saves re-typing.
6. OPU (oocyte retrieval)	Record consent, date/time, surgeon and embryologists, trigger, and oocyte / fertilisation counts.
7. Embryology	Record fertilisation (IVF / ICSI), add oocytes, and track day-by-day embryo growth with grades and images. Semen analysis is captured here too.
8. Vitrification, storage & PGD	Vitrify embryos into labelled storage positions; thaw, renew, or send/receive PGD results.
9. Outcome	Record the result: transfer date, pregnancy, Beta HCG, clinical pregnancy. The cycle's treatment funnel and the dashboard update automatically.
10. Consent & counselling	Attach signed consent forms and keep counselling notes for the couple, with status tracking.
11. Billing	Raise a bill, issue it (it then locks), and collect receipts. Bill totals and balances are calculated and protected automatically.
12. Insight	The dashboard, reports and analytics show live figures - cycles per month, outcomes, 90-day conversion and billing.

4. How staff find their way around

- **Card-based home.** Signing in lands on a clean home screen with live figures and a grid of module cards - Dashboard, Front Desk, IVF Worklists, Embryology, Donors, Billing, Documents, Inventory, Insights and Administration.
- **Open a card.** Tapping a module card opens that area and shows its tools as cards. One more tap starts the task.
- **Side menu.** A slim side menu lists the same modules; the admin sees all, other roles see fewer.
- **Fast access.** A top search finds any patient by MRN, name or phone; a 'Jump to a tool' box finds any screen; staff can star favourites for one-tap access.
- **Worklists.** Ready-made daily lists - Patients for OPU / ET / IUI, Surgeries Today, Monitor / Vitrify / Thaw Embryos, PGD - take staff straight to the right place.

5. Security & trust

- **Role-based access** enforced in the database, not just hidden in the screen.
- **Signed clinical records and issued bills are locked** - changes are made by addendum, never silent edits.
- **Full audit log** of who created, changed or deleted key clinical and financial data.
- **Private document storage** - files open through secure, time-limited links.
- **Cloud-hosted** on managed infrastructure (Vercel + Supabase) with encrypted connections.

6. The 10-minute demo script

A simple order to walk the doctor through. For each step: **do** the action, then **say** the line.

1. Open & sign in

- **Do:** Open the link on the iPad. Tap the **Admin** quick-login.

Say: 'This is the whole clinic in one place. Everyone logs in with their own account; what they see depends on their role.'

2. The home screen

- **Do:** Point to the live figures and the module cards.

Say: 'The moment you log in you see today's numbers and every part of the clinic as a card. You tap a card to go to that work.'

3. Register a patient

- **Do:** Open Front Desk -> Register Patient Visit. Fill a name and tap Register.

Say: 'Reception registers the patient once, here. The MRN is generated automatically and it warns about duplicates.'

4. The patient record & a cycle

- **Do:** Open a patient (use a seeded one), show the EMR tabs, open IVF Cycles, open a cycle.

Say: 'Everything about the couple lives here - visits, history, consents, documents, and their IVF cycles.'

5. Stimulation & embryology

- **Do:** On the cycle, show the Stimulation grid and response chart, then the Embryology tab.

Say: 'This is built for IVF: day-by-day stimulation with a response chart, then oocytes and embryo growth tracked in the lab.'

6. Outcome & the funnel

- **Do:** Open the cycle Overview; show the treatment funnel and latest outcome.

Say: 'From oocytes retrieved to clinical pregnancy, the whole cycle is summarised at a glance.'

7. Billing

- **Do:** Open Billing, open a bill; show total, issue and receipt.

Say: 'Finance is connected too - bills calculate themselves, issued bills lock, and receipts can never exceed the balance.'

8. Dashboard & analytics

- **Do:** Open Dashboard; show the charts and 90-day conversion.

Say: 'And management sees it all live - cycles, outcomes, conversion and billing - without anyone building a report.'

9. Different roles

- **Do:** Sign out, tap the **Nurse** or **Billing** demo login.

Say: 'And each person only sees what they need - this is the nurse's view, this is billing's view. Same system, right access.'

7. How to close the demo

- Return to the home screen so the doctor sees the calm, organised overview one last time.
- Sign out (top-right) - point out that everything entered is already saved and audit-logged; nothing is lost.
- Leave them the link to try on their own iPad.

Closing line

Say: 'This is the clinic's own Medics workflow, rebuilt as a modern, secure, tablet-first system - one place for every patient, every cycle and every outcome. It's live today, and we'll tune the clinical details with your team.'

---

8. Status & what we need from the clinic

Be upfront - it builds trust.

Ready and working today

- Full patient, couple and IVF cycle records; stimulation, OPU, embryology, vitrification, storage, outcomes.
- Consent, counselling, documents, billing & receipts, inventory, donors.
- Dashboard, reports, analytics and data export; user management; audit log.
- Live on the cloud, on iPad, with demo data to explore.

To finalise with the clinic's input

- Confirm a few clinical details still marked as provisional (some dropdown values, the semen-analysis fields, the Case Sheet, and the exact definitions used on the dashboard).
- Confirm the exact role permissions for each staff member.
- Agree the hosting / data-residency and backup plan for real patient data, and enable the additional login protections before go-live.
